

Exp No: 2**Run a basic Word Count Map Reduce program to understand Map Reduce Paradigm****Aim:**

To Run a basic Word Count MapReduce program to understand Map Reduce Paradigm.

Procedure:**Step 1: Create Data File:**

Create a file named "word_count_data.txt" and populate it with text data that you wish to analyze. Login with your Hadoop user.

```
GNU nano 7.2 word_count.txt
Made it to LA, yeah
Finally in LA, yeah
Lookin' for the weed though
Tryna make my own dough
Callin' for Maria
Lost without Maria

^G Help      ^O Write Out  ^W Where Is   ^K Cut        ^T Execute    ^C Location   M-U Undo
^X Exit      ^R Read File  ^\ Replace    ^U Paste      ^J Justify    ^_ Go To Line M-E Redo
```

Step 2: Mapper Logic - mapper.py:

Create a file named "mapper.py" to implement the logic for the mapper. The mapper will read input data from STDIN, split lines into words, and output each word with its count.

```
nano mapper.py
```

```
# Copy and paste the mapper.py code
```

```
#!/usr/bin/env python3
```

```
# import sys because we need to read and write data to STDIN and STDOUT
```

```
#!/usr/bin/python3
```

```
import sys
```

```
for line in sys.stdin:
```

```
    line = line.strip()
```

```
    # remove leading and trailing whitespace
```

```
    words = line.split()
```

```
    # split the line into words for word in words:
```

```
    nano word_count.txt print( '%s\t%s' % (word, 1))
```

Step 3: Reducer Logic - reducer.py:

Create a file named "reducer.py" to implement the logic for the reducer. The reducer will aggregate the occurrences of each word and generate the final output.

```
nano reducer.py
```

```
# Copy and paste the reducer.py code
```

```
reducer.py
```

```
#!/usr/bin/python3
```

```
from operator import itemgetter
```

```
import sys
```

```
current_word = None
```

```
current_count = 0
```

```
word = None
```

```
for line in sys.stdin:
```

```
    line = line.strip()
```

```
    word, count = line.split('\t', 1)
```

```
    try:
```

```
        count = int(count)
```

```
    except ValueError:
```

```
        continue
```

```
    if current_word == word:
```

```
        current_count += count
```

```
    else:
```

```
        if current_word:
```

```
            print( '%s\t%s' % (current_word, current_count))
```

```
        current_count = count
```

```
        current_word = word
```

```
if current_word == word:
```

```
    print( '%s\t%s' % (current_word, current_count))
```

Step 4: Prepare Hadoop Environment:

Start the Hadoop daemons and create a directory in HDFS to store your data.

```
start-all.sh
```

```
hdfsdfs -mkdir /word_count_in_python
```

```
hdfsdfs -copyFromLocal /path/to/word_count.txt/word_count_in_python
```

Step 5: Make Python Files Executable:

Give executable permissions to your mapper.py and reducer.py files.

```
chmod 777 mapper.py reducer.py
```

Step 6: Run Word Count using Hadoop Streaming:

Download the latest hadoop-streaming jar file and place it in a location you can easily access.

Then run the Word Count program using Hadoop Streaming.

```
hadoop jar /path/to/hadoop-streaming-3.3.6.jar \
-input /word_count_in_python/word_count_data.txt \
-output /word_count_in_python/new_output \
-mapper /path/to/mapper.py \
-reducer /path/to/reducer.py
```

```
C:\hadoop\sbin>hadoop jar C:\hadoop\share\hadoop\tools\lib\hadoop-streaming-3.3.6.jar ^
More? -input /user/hadoop/input/data.txt ^
More? -output /user/output ^
More? -mapper "python C:\Users\nithu\OneDrive\Documents\wordcount\mapper.py" ^
More? -reducer "python C:\Users\nithu\OneDrive\Documents\wordcount\reducer.py"

```

Step 8: Check Output:

Check the output of the Word Count program in the specified HDFS output directory.

```
hdfs dfs -cat /word_count_in_python/new_output/part-00000
```

```

osboxes@fedora:~
[--setfacl [-R] [[-b|-k] {-m|-x <acl_spec>} <path>][--set <acl_spec> <path>]]
[--setfattr {-n name [-v value] | -x name} <path>]
[--setrep [-R] [-w] <rep> <path> ...]
[--stat [format] <path> ...]
[--tail [-f] [-s <sleep interval>] <file>]
[--test [-defswrz] <path>]
[--text [-ignoreCrc] <src> ...]
[--touch [-a] [-m] [-t TIMESTAMP (yyyyMMdd:HHmmss) ] [-c] <path> ...]
[--touchz <path> ...]
[--truncate [-w] <length> <path> ...]
[--usage [cmd ...]]

Generic options supported are:
--conf <configuration file>      specify an application configuration file
-D <property=value>              define a value for a given property
--fs <file:///hdfs://namenode:port> specify default filesystem URL to use, overrides 'fs.defaultFS' property from configurations.
--jt <local|resourceManager:port> specify a ResourceManager
--files <file1,...>              specify a comma-separated list of files to be copied to the map reduce cluster
--libjars <jar1,...>            specify a comma-separated list of jar files to be included in the classpath
--archives <archive1,...>      specify a comma-separated list of archives to be unarchived on the compute machines

The general command line syntax is:
command [genericOptions] [commandOptions]

osboxes@fedora:~$ hdfs dfs -cat /output/part-r-00000
all      1
and      3
at        2

sins       1
the        5
time       2
wine       1
you        1
osboxes@fedora:~$

```

Result:

Thus, the program for basic Word Count Map Reduce has been executed successfully.
